# Testing a Wordfast Server TM Connection with Wordfast Pro (version 5 or higher)

To test your connection to a Wordfast Server (WFS) TM:

1. Generate a WFS account URL (see WFS Quickstart Guide). This URL usually looks like this:
   wf://Name:Password@10.11.12.13:47110
   It contains the following information:
   a. Account Name and Account Password (e.g. Name:Password)
   b. IP address (e.g 10.11.12.13)
   c. Port# (usually 47110 by default)

2. Open Wordfast Pro and click the *Quick Tools* icon.

3. Under the *Analysis* tab, click the *Connect to Remote* icon.

4. Click the *WF Server* tab (1).
5. Enter a name for the TM in the *Symbolic Name* field (2), paste the account URL into the *URL* field (3) and then click on *Test* (4).

Testing a Wordfast Server TM Connection
with Wordfast Pro (version 5 or higher)

6. You should see a message at the bottom that says "Connection successful."

Problems?

1. Make sure WFS is running and that the *Server active* box is ticked under the *Activity* tab.
2. If attempting a WAN connection (i.e. remote connection), make sure you have opened your firewall to allow incoming and outgoing connections for Wordfast Server through port 47110.
3. See the troubleshooting section the WFS manual as the problem may be more complicated and related to your router settings.

Next steps…

1. Provide users with the WFS account URL so they can add a Remote TM to a project (see Project Quickstart Guide for translators and PMs).
